## POINT-TO-POINT CONNECTIONS P1

**Serial/Parallel Ports:** Common WAN connection: Point-to-point: LANs to SP WANs/LAN segments w/in enterprise

<b>LAN-to-WAN/Point-to-point</b>	<b>AKA: Serial connection/leased-line</b> <ul style="list-style-type: none"><li>• Lines leased from carrier (phone): Dedicated</li><li>• Companies pay for connection bet 2 remote sites</li><li>• Price based on BW/distance bet sites</li></ul>
----------------------------------	---

**Serial comm:** Data transmission: Bits transmitted sequentially over single chan

- Pipe big enough to fit 1 ball at time: Multiple balls go into pipe: 1 at time: 1 exit point
- Serial port: Bidirectional
- Less expensive: Fewer wires/cheaper cables/less pins
- WAN: Data encapsulated by comms protocol used by sending rtr
  - Encapsulated frame sent on phys medium to WAN
  - Receiving rtr uses same protocol to de-encapsulate frame

**Parallel comm:** Bits transmitted simultaneously over multiple wires

- Theoretically: Xfers 8x faster than serial
- Sends byte (8 bits) in time serial sends single bit

**Issues:** Crosstalk as wire length increases/Clock skew

**Clock skew:** Data across various wires doesn't arrive at same time: Sync issues

- Most parallel: Only 1-direction: Outbound-only

**3 serial comm standards/LAN-to-WAN connections:**

<b>RS-232</b>	Most serial ports conform RS-232C RS-422 RS-423 standards <ul style="list-style-type: none"><li>• 9-pin/25-pin connectors used</li><li>• General-purpose int: Almost any device type</li><li>• Replaced by faster standards (USB)</li></ul>
<b>V.35</b>	<b>Modem-to-multiplexer</b> comm: ITU standard: High-speed sync data exchange <ul style="list-style-type: none"><li>• Combined BW of 7 phone circuits</li><li>• Serial designed to support higher rates/connectivity bet DTEs/DCEs over digital lines</li></ul>
<b>HSSI</b>	<b>High-Speed Serial Int:</b> Up to 52 Mb/s <ul style="list-style-type: none"><li>• Rtrs on LANs w/WANs over high-speed lines (T3)</li><li>• Token Ring/Ethernet</li><li>• DTE/DCE int dev by Cisco/T3</li></ul>

**Point-to-Point Comm Links:** Dedicated connection

- Single/pre-established WAN comm path: Connects 2 geo distant sites
- NOT limited to connections that cross land
- More \$ than shared services
- Dedicated capacity removes latency/jitter bet endpoints

**TDM: Time-Division Multiplexing**

**Multiplexing:** Scheme allows multiple logical sigs to share single phys chan

**2 Types of Multiplexing**

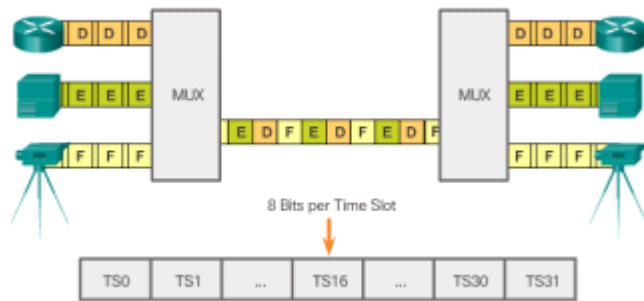

1. TDM: Time-Division Multiplexing
2. STDM: Statistical Time-Division Multiplexing

**TDM: Time-Division Multiplexing**

Bell Labs: To max amt of voice traffic over carried medium: Before? Phone calls required own physical link

- Expensive/unscalable

**TDM: Divides BW of single link into separate time slots**

- Transmits over 2/more chans (data stream) over same link by allocating diff time slots for trans of each chan
- Chans take turns using link
- Phys layer concept: No regard for nature of info multiplexed to output chan
- Independent of L2 protocol used by input chans

**MUX: Multiplexer:** Accepts 3 separate sigs: MUX breaks each sig into segments: MUX puts each seg into single chan

**Interleaving:** Keeps track of #/sequence of bits from each specific trans so they can quickly be reassembled

**STDM: Statistical Time-Division Multiplexing**

**STDM:** Dev to overcome inefficiency w/TDM: Var time slot length:

- Allows chans to COMPETE for any free slot space
- Buffer mem: Temp stores data during periods of peak traffic
- Doesn't waste line time w/inactive chans
- Requires each trans to carry ID info/chan identifier

**TDM Examples**

**SONET/SDH:** Synchronous Optical Networking/Synchronous Digital Hierarchy

- Standard for optical transport of TDM data
- SONET: N/America/SDH: Elsewhere
- 2 closely-related standards: Specify int params/rates/framing fmtns/multiplexing methods
  - Mgmt for sync TDM over fiber
  - Example of STDM

**SONET/SDH:** Takes in bit streams: Multiplexes them: Optically modulates sigs

- Sends sigs out using a light emitting device over fiber w/bit rate equal to  $x \cdot n$  (incoming bit rate)
- Traffic arriving at SONET multiplexer from 4 places at  $X$  Gb/s goes out

**Demarcation Point**

Prior to deregulation in N/America/countries: Phone companies: Owned local loop

**Local loop:** Line from premises of phone sub to phone CO

- Deregulation forced phone companies to unbundle local loop infrastructure

**Delineation is demarcation/demarc point:** Marks where your network ints are owned by another org

- Int bet CPE: Customer Premises Equip/Network SP equip

**CSU/DSU:** Provides clocking sig to cust equip int from DSU/terms chan transport media of carrier onto CSU

**DTE-DCE:**

<b>CPE</b>	Generally rtr: DTE: Could also be term/computer/printer/fax machine: Connects directly to SP network
<b>DCE</b>	<b>Commonly modem or CSU/DSU:</b> Device used to convert usr data from DTE into form acceptable to WAN SP trans link <ul style="list-style-type: none"> <li>• Sig received at remote DCE: Decodes sig back into seq of bits</li> <li>• Remote DCE then sigs this seq to remote DTE</li> </ul>

**Serial Cables:**

**Originally, DCEs/DTEs based on 2 types of equip:**

1. Term equip: Generated/received data
2. Comm equip: Only relayed data

**DTE/DCE int for a particular standard defines following specs:**

<b>Mech/phys</b>	# of pins/connector type
<b>Electrical</b>	Defines voltage lvls for 0/1
<b>Functional</b>	Specifies functions performed by assigning meanings to each of sig lines in int
<b>Procedural</b>	Specifies the seq of events for transmitting data
<b>Original RS-232</b>	Standard only defined connection of DTEs w/DCEs, which were modems.

**DTE to DCE cable: Shielded serial transition**

- Rtr end of shielded serial transition may be DB-60 connector
- WAN provider/CSU/DSU dictates cable type
- Cisco devices support: EIA/TIA-232, EIA/TIA-449, V.35, X.21, and EIA/TIA-530 serial standards

**WAN Encapsulation Protocols:**

- Data encapsulated into frames before crossing WAN link
- Appropriate L2 encapsulation type must be config

**Types of WAN protocol:**

<b>HDLC</b>	<b>Default encapsulation type:</b> <ul style="list-style-type: none"> <li>• Point-to-point/dedicated links/circuit-switched connections <ul style="list-style-type: none"> <li>◦ When link uses 2 Cisco devices</li> </ul> </li> <li>• HDLC: Basis for sync PPP: Many servers connect WAN most commonly Internet</li> </ul>
<b>PPP</b>	Rtr-to-rtr/host-to-network connections over sync/async circuits <ul style="list-style-type: none"> <li>• Works w/7 network layer protocols (IPv4/IPv6)</li> <li>• HDLC encapsulation protocol: Built-in sec mechs such as PAP/CHAP</li> </ul>
<b>SLIP: Serial Line Internet Protocol</b>	Standard protocol for point-to-point serial connections using TCP/IP <ul style="list-style-type: none"> <li>• SLIP largely displaced by PPP</li> </ul>
<b>X.25/LAPB</b>	<b>Link Access Procedure Balanced:</b> <b>ITU-T standard:</b> How connections bet DTE/DCE maintained for remote access/comms <ul style="list-style-type: none"> <li>• Public data networks</li> <li>• X.25 specifies LAPB: DLL protocol</li> <li>• X.25 predecessor to Frame Relay</li> </ul>
<b>Frame Relay</b>	Industry standard: Switched, DLL protocol: Handles multiple virtual circuits <ul style="list-style-type: none"> <li>• Next gen protocol after X.25</li> <li>• Eliminates time-consuming processes (error correction/flow control) employed in X.25</li> </ul>
<b>ATM</b>	International standard for cell relay: <ul style="list-style-type: none"> <li>• Devices send multiple service types (voice/data) in fixed-length (53-byte) cells</li> </ul>

- Fixed-length cells allow processing to occur in HW: Reducing transit delays
- ATM takes advantage of high-speed trans media: E3/SONET/T3

**HDLC Encapsulation:** Bit-oriented synchronous DLL protocol: Developed by ISO: International Org for Standardization

- ISO 13239: Current standard
- Dev from SDLC: Synchronous Data Link Control standard proposed in 70's
- Both connection/connectionless service

**Synchronous serial transmission:** Error-free comm bet 2 points:

- Defines L2 framing structure: Flow/error control through acknowledgements
- Each frame: Same fmt: Whether data or control
- When frames transmitted over sync/async links: Links have no mech to mark beginning/end of them

**HDLC uses frame delimiter (flag):** Marks beginning/end of each frame:

**cHDLC:** Cisco dev extension to HDLC protocol to solve inability to provide multiprotocol support

- cHDLC frames contain field for ID network protocol being encapsulated

Standard HDLC

Supports only single-protocol environments.

Cisco HDLC

Uses a protocol data field to support multiprotocol environments.

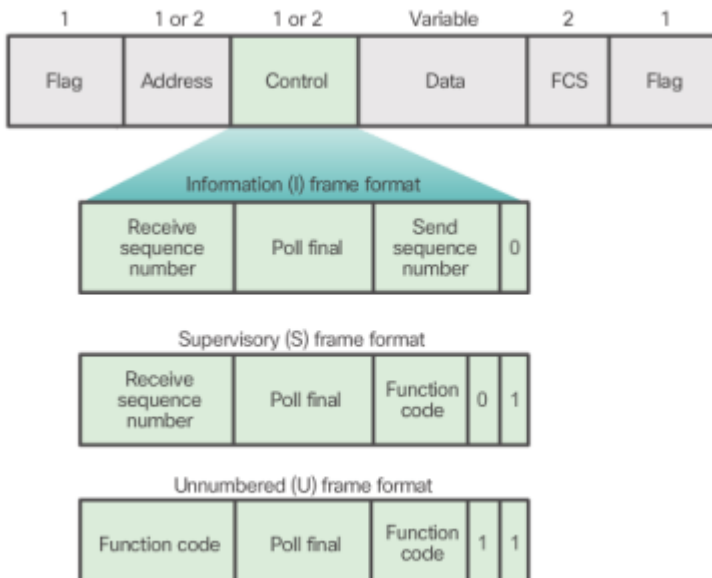

## HDLC Frame Types

3 frame types: Each diff control field fmt:

<b>Flag</b>	<b>Initiates/terminates error checking:</b> <ul style="list-style-type: none"> <li>• <b>Frame:</b> Always starts/ends w/8-bit flag field</li> <li>• <b>Bit pattern:</b> 01111110</li> <li>• <b>B/C pattern</b> occurs in actual data: HDLC always inserts 0 bit after every 5 consecutive 1's in data field</li> <li>• <b>Flag seq:</b> Can only occur at frame ends</li> <li>• <b>Receiving sys:</b> Strips out inserted bits</li> <li>• Transmitted consecutively: End flag of 1st frame used as start flag of next frame</li> </ul>
<b>Address</b>	Contains HDLC addr of 2ndary station: Can contain specific/group/broadcast addr <b>Primary addr:</b> Comm source/dest: <ul style="list-style-type: none"> <li>• Eliminates need to include addr of primary</li> </ul>
<b>Control</b>	Field uses 3 diff fmts (depends on HDLC frame used): <ul style="list-style-type: none"> <li>• <b>Info Frame [I]: I-frames:</b> <ul style="list-style-type: none"> <li>▪ Carry upper layer info/some control info</li> <li>▪ Sends/receives seq #'s   P/F: Poll final bit: Performs flow/error control</li> <li>▪ <b>Send seq #:</b> The # of frame to be sent next</li> <li>▪ <b>Receive seq #:</b> The # of frame to be received next</li> <li>▪ Both sender/receiver maintain seq #'s               <ul style="list-style-type: none"> <li>□ <b>Primary station:</b> Uses P/F bit to tell 2ndary whether it needs immed response</li> <li>□ <b>2dary station:</b> Uses P/F bit to tell primary whether current frame is last in current response</li> </ul> </li> </ul> </li> <li>• <b>Supervisory Frame [S]: S-frames:</b> <ul style="list-style-type: none"> <li>▪ Provide control info</li> <li>▪ Can req/suspend transmission/report on status/ack receipt of I-frames</li> <li>▪ Don't have an info field</li> </ul> </li> <li>• <b>Unnumbered Frame (U): U-frames:</b></li> </ul>

	<ul style="list-style-type: none"> <li>○ Support control purposes/not seq</li> <li>○ Depend on function of U-frame: Control field is 1 or 2 bytes</li> <li>○ Some have an info field</li> </ul>
<b>Protocol</b>	<b>Only used in cHDLC:</b> Field specifies protocol type encapsulated w/in frame (0x0800 for IP)
<b>Data</b>	Field contains PIU: Path Info Unit    or     XID: Exchange ID Info
<b>FCS</b>	<b>Frame Check Sequence (FCS)</b> <ul style="list-style-type: none"> <li>• Precedes ending flag delimiter: Usually a CRC: Cyclic Redundancy Check calc remainder</li> <li>• CRC calc redone in receiver: If results differ from value in original frame: Error assumed</li> </ul>

### Config HDLC Encapsulation:

- cHDLC default encapsulation method used by Cisco on sync serial lines
- Use as point-to-point protocol on leased lines bet 2 Cisco devices
- If non-Cisco: Use sync PPP

**If default encapsulation method changed:** Enter int config of serial int  
**encapsulation hdlc** [*priv exec*] Specify/re-enable encapsulation protocol on int

### Troubleshooting Serial Int

**show interfaces serial** Displays info specific to serial ints

- HDLC config: Encapsulation HDLC should be in output

**Returns 1 of 6 possible states: 5 are problems**

Status Line	Possible Condition	Problem/Solution
<b>Serial up: Line up</b>	Good	No action
<b>Serial down: Line down</b>	Rtr not sensing CD: Carrier Detect sig: <ul style="list-style-type: none"> <li>• CD not active</li> </ul> WAN SP problem Cabling faulty/incorrect HW failure: CSU/DSU	<ol style="list-style-type: none"> <li>1. Check LED's on CSU/DSU to see CD active               <ul style="list-style-type: none"> <li>▪ Breakout box line to check CD sig</li> </ul> </li> <li>2. Verify cable/int used</li> <li>3. Breakout box/check control leads</li> <li>4. Contact SP</li> <li>5. Swap faulty parts</li> <li>6. If rtr HW: Change serial line to other port:               <ul style="list-style-type: none"> <li>▪ If comes up previous int problem</li> </ul> </li> </ol>
<b>Serial up: Line down</b>	Local Rtr misconfig Keepalives not sent by remote rtr Leased-line/SP problem <b>Timing problem on cable</b> <b>SCTE: Serial Clock Transmit External:</b>	<ol style="list-style-type: none"> <li>1. Put modem/CSU/DSU in local loopback mode               <ul style="list-style-type: none"> <li>▪ <b>sh int serial</b> Determine if line comes up</li> <li>▪ If yes: WAN/SP problem</li> </ul> </li> <li>2. Appears on remote end:</li> </ol>

	<ul style="list-style-type: none"> <li>• Not set on CSU/DSU</li> <li>• Made for clock phase shift on long cables</li> </ul> <p>When DCE devices uses SCTE:</p> <ul style="list-style-type: none"> <li>• Not internal clock sampled from DTE</li> <li>• Better to sample data w/out error</li> <li>• Even if phase shift in cable</li> </ul>	<ul style="list-style-type: none"> <li>▪ Repeat step 1</li> </ul> <p>3. Verify cabling: <b>show controllers</b> [exec]</p> <p>4. <b>debug serial int</b> [exec]</p> <p>5. If line doesn't come up in loopback:</p> <ul style="list-style-type: none"> <li>▪ If shows keepalive counter not incrementing:</li> <li>▪ Rtr HW problem: Swap rtr int HW</li> </ul> <p>6. Line comes up/keepalive counter increments:</p> <ul style="list-style-type: none"> <li>▪ Problem not in local rtr</li> </ul> <p>7. Faulty HW: Change serial line to unused port</p> <ul style="list-style-type: none"> <li>▪ Connection comes up? Int issue</li> </ul>
<b>Serial up, line up (looped)</b>	<p>Loop in circuit:</p> <ul style="list-style-type: none"> <li>• Seq # in keepalive packet</li> <li>• Changes to random # when loop detected</li> </ul>	<p>1. <b>sh run</b> for loopback int config entries</p> <p>2. <b>no loopback</b> [int config]</p> <p>3. Examine CSU/DSU: Manual loopback mode?</p> <ul style="list-style-type: none"> <li>▪ Disable mode: Reset CSU/DSU</li> </ul> <p>4. Contact SP</p>
<b>Serial up, line down (disabled)</b>	<p>High error rate: WAN SP issue CSU/DSU HW problem Rtr HW (int) bad</p>	<p>1. Troubleshoot: Serial analyzer/breakout box</p> <ul style="list-style-type: none"> <li>▪ Look for toggling CTS/DSR sigs</li> </ul> <p>2. Loop CSU/DSU (DTE loop)</p> <ul style="list-style-type: none"> <li>▪ If continues: Most likely HW</li> </ul> <p>3. Swap bad HW</p>
<b>Serial admin down, line down</b>	<p>Rtr config includes shutdown Duplicate IP exists</p>	<p>1. Check config for <b>shutdown</b></p> <ul style="list-style-type: none"> <li>• <b>no shut</b></li> </ul> <p>1. Verify no identical IPs: <b>sh run/sh int</b></p>

**show controllers** Indicates state of int chans/whether cable attached to int

**show controllers cbus**

**PPP:** When need to connect to non-Cisco rtr: PPP encapsulation

- Designed for compatibility
- Encapsulates data frames for trans over L2 phys links
- Establishes direct connection using serial/phone/trunk/cellular/radio/fiber links

**3 main components:**

<b>HDLC-like</b>	Framing for transporting multiprotocol packets over point-to-point
<b>LCP</b>	<p><b>Extensible Link Control Protocol:</b></p> <ul style="list-style-type: none"> <li>• Establishing/config/testing data-link connection</li> </ul>
<b>NCP's</b>	<p><b>Network Control Protocols:</b></p> <ul style="list-style-type: none"> <li>• Establishing/config diff network layer protocols</li> <li>• PPP allows simultaneous use of multiple network layer protocols</li> <li>• Common NCPs: IPv4/IPv6/AppleTalk/Novell IPX/Cisco/SNA/Compression</li> </ul>

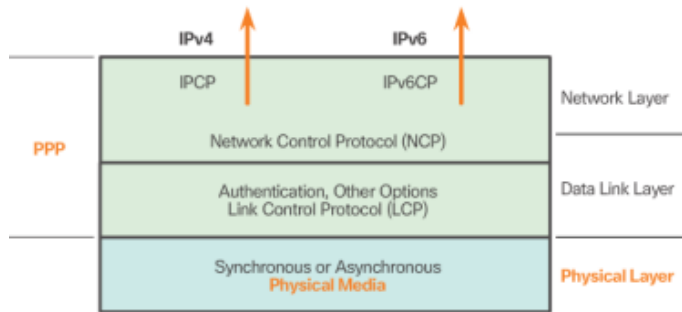

**Advantages:** Originally: Encapsulation protocol for transporting IPv4 traffic over point-to-point links

- Method for transporting multiprotocol packets over point-to-point
- Not proprietary

**Features not available in HDLC:**

- Link quality mgmt: Monitors quality of link
- If too many errors: PPP takes link down
- Supports PAP/CHAP auth

**Layered Architecture**

**Layered architecture:** A logical model/design/blueprint that aids in comm bet interconnecting layers

**At physical layer: Can config PPP on a range of ints including:**

- Async serial
- Sync serial
- HSSI
- ISDN

**Ops across any DTE/DCE int (RS-232-C/422/423/V.35)**

- **Absolute req:** Full-duplex circuit (dedicated/switched)
- Can op in an async/sync bit-serial mode, transparent to PPP link layer frames
- No restrictions on trans rate
- Most work done by PPP at DLL/Network layers by LCP/NCP's

**LCP:** Sets up PPP connection/params

**NCPs:** Handle higher layer protocol configs/LCP terms PPP

**LCP: Link Control Protocol**

**Functions w/in DLL:**

- Establishing/config/testing/data-link connection
- LCP establishes point-to-point link
  - Also negotiates/sets up control options on WAN link: Handled by the NCP's

Provides auto config of ints at each end including:

- Varying limits on packet size
- Detecting common misconfig errors
- Term link
- Determining when link is func properly/failing
- After link establish: PPP uses LCP to auto agree on encapsulation fmtns such as auth/compression/error detection

**NCP: Network Control Protocol**

- PPP permits multiple network layer protocols to op on same comm link
- For every network layer protocol used: PPP uses separate NCP
- Includes func fields containing standardized codes to indicate network layer protocol PPP encapsulates
- Each NCP manages specific needs req by its network layer protocols
- Various NCP components encapsulate/negotiate options for multiple network layer protocols

**PPP Frame Structure**

**Consists of 6 fields:**

<b>Flag</b>	<b>Single byte:</b> Indicates beginning/end of frame <ul style="list-style-type: none"><li>• Bin seq 01111110</li><li>• Successive PPP frames: Only single Flag char used</li></ul>
<b>Address</b>	<b>Single byte:</b> Bin seq 11111111 [standard broadcast addr] <ul style="list-style-type: none"><li>• PPP doesn't assign individual station addr</li></ul>
<b>Control</b>	<b>Single byte:</b> Bin seq 00000011 <ul style="list-style-type: none"><li>• Calls for trans of usr data in unseq frame</li><li>• Provides connectionless link service: Requires establishment of data links/link stations</li><li>• PPP link: Dest node doesn't need to be addressed<ul style="list-style-type: none"><li>○ For PPP: Address field set to 0xFF broadcast</li><li>○ If both PPP peers agree to perform address/control field compression during LCP negotiation</li><li>○ Address field not included</li></ul></li></ul>
<b>Protocol</b>	<b>2 bytes ID protocol encapsulated in info field of frame</b> <ul style="list-style-type: none"><li>• ID's protocol of PPP payload</li><li>• If both PPP peers agree to perform protocol field compression during LCP negotiation:<ul style="list-style-type: none"><li>○ Protocol field is 1 byte for ID in range 0x00-00 to 0x00-FF</li><li>○ Most up-to-date values of field specified in most recent Assigned Numbers RFC</li></ul></li></ul>
<b>Data</b>	<b>0/more bytes contain datagram for protocol specified in protocol field</b> <ul style="list-style-type: none"><li>• End of info field found by locating closing flag seq/allowing 2 bytes for FCS field</li><li>• Default max length of info field: 1,500 bytes</li><li>• Consenting PPP implementations can use other values for max info</li></ul>
<b>FCS</b>	<b>Frame Check Sequence:</b> Normally 16 bits (2 bytes) <ul style="list-style-type: none"><li>• Consenting PPP implementations can use 32-bit (4-byte) FCS for improved error detection</li><li>• If receiver's calc of FCS doesn't match FCS in frame: Frame is silently discarded</li><li>• LCPs can negotiate mods to PPP frames:<ul style="list-style-type: none"><li>○ Mod frames: Always distinguishable from standard ones</li></ul></li></ul>
